

A System that solves all your communication problems

SPEAK . LISTEN . SEE CONTROL

A Better Way of Communication

Imperfect communication and its consequences can be avoided. While it is difficult to estimate the cost of vain call attempts, loss of time, annoyance and unnecessary call backs, it is clear that peace of mind and motivated employers will result in satisfied patients.

Contrary to customary intercom systems, the West-Com MARC II features the following benefits:

- Visual display of information
- Saves time and money
- Excellent speech quality
- Ease of use
- Improves working conditions
- Versatile and easily expandable
- Connects to and controls other systems
- Modular construction

Complete Integrated *Communication Solution*

In many cases, there are often several parallel systems installed, but only a small part of each system's functions and possibilities are being used, in spite of the high investment costs and costs of installation.

Now the West-Com MARC II intercom system gives you an additional advantage that cannot be disregarded: the

integration of several independent systems into a communications net.

There are no limits for other applications or connections to different kinds of systems. MARC II solves all your internal communication problems.

MARC II System Components

WALL INTERCOM

MARC II wall-mounted intercom stations have a four-digit LCD display, four LED indicators, keypad with ten-digit keys and eight function keys, volume control, microphone and speaker. The LCD display indicates the number dialed, the number of the terminal that has left a call request, the number of your terminal, the number to which incoming calls are transferred, any messages that are stored in the station and the current time. The stations are designed for hands-free communication between the user station and any other station in the system.

DESK INTERCOM

MARC II desktop intercom stations feature a four digit LCD display, four LED indicators, volume control, a keypad with ten digit keys and eight function keys. The LCD display indicates the number dialed, the number

of the terminal that left a call request, the number of your terminal, the number to which incoming calls are transferred, any messages that are stored in the station and the current time. It also has a volume control on the station. The desktop stations are designed for hands-free communication between the user's station and any other station in the system.

DOOR & GATE INTERCOM

The West-Call Door and Gate Intercom Station is an integral part of the MARC II Intercom System. Pressing the pre-programmed button places the calling party in instant communication with the answering station. Adjacent to each call button, there is a nameplate with the name of the recipient of the call. When the desired call connection is made, an audible signal is heard and a CALL indicator lamp is illuminated.
